

Nuntiq at a glance

Nuntiq builds AP Receiving, an accounts payable intake platform. Invoices arrive by email, direct supplier send, upload, API or e-invoice file and land in one queue. AI reads each document, the company's business rules enrich and validate the data, and the AP team reviews only the exceptions before the invoice goes to the ERP.

01 Company

Company	Nuntiq
Headquarters	Chicago, Illinois
Founder	Ewout Vocking, in finance automation since 2012
Product	AP Receiving, an accounts payable intake platform
Stage	New company, now onboarding its first pilot customers in the United States
Built for	Mid-sized and enterprise AP teams, and the service providers who run AP for them
Name	From the Latin <i>nuntius</i> , messenger: every invoice is a message from a supplier
Online	nuntiq.com · developer docs nuntiq.dev · benchmark nomorebaddata.com

02 Why it exists

Only 38 in 100 invoices go through without a person touching them.

Ardent Partners research, 2026 (vendor-sponsored survey).

Approval, matching and payment tools have improved for years, but receiving the invoice still runs on shared inboxes, supplier templates and manual corrections. Errors surface late, during purchase order matching or after approval. AP Receiving fixes the intake step, so only clean, checked data moves on.

03 What AP Receiving does

Receive

Email, supplier send, upload, API and e-invoice files in one queue.

Read

AI reads every layout from the first invoice. No templates.

Enrich

Matches entity, supplier and PO from your master data.

Check

Your validation rules and duplicate detection, before posting.

Deliver

Clean data to the ERP. Exceptions go to your team.

04 Key facts

- **Any channel:** as many receiving addresses as needed, per supplier, department, entity or document type.
- **E-invoices read directly:** UBL, CII, Factur-X and ZUGFeRD, plus JSON, CSV and EDI, without OCR.
- **Not tied to one AI model:** models from several leading providers, chosen per step. Newer models are tested on invoice capture before they go live.
- **No training on customer data:** documents are never used to train AI models.
- **Regional or global AI:** each customer chooses regional AI processing, or global endpoints with the newest models.
- **Built for data residency:** runs on Amazon Web Services, in the US East region today, more regions as customers need them. Each customer's transactional data sits in its own database, encrypted with automatically rotated AWS KMS keys.
- **Audit-ready:** originals are stored exactly as they arrived, and every action is recorded with user and time.
- **Fast start:** processing your own invoices within a week; connect your ERP whenever your IT team is ready.

PILOT PROGRAM

A free pilot on your own invoices.

AP teams can apply by sending sample invoices through nuntiq.com/contact.
